What to Know About the 2025 HVAC Refrigerant Change

In 2020, the American Innovation and Manufacturing (AIM) Act was enacted into law, which authorizes a 15-year phasedown of hydrofluorocarbons (HFCs) across of a variety of applications—including HVAC.

Come 2025, the Environmental Protection Agency (EPA) will set a 750 global warming potential (GWP) limit for air conditioning. This means that R-410A, with a GWP of 2,088, will no longer be able to be used in new equipment.

We are already seeing product price increases across the all brands. New equipment in 2025 is slated for an additional 15-20% price increase.

If you have been thinking about a new HVAC system, now is the time to act. If you are not sure, call us for a **FREE IN HOME CONSULTATION** today!
